In the columns section you can:

- Move attributes up or down the list by selecting the rows and then using the up and down arrows to shift the rows. Multiple rows can be selected and moved at any one time.
- Add an attribute with the plus button. This will add an empty row at the bottom of the table where you can select a field to be the attribute value or create an attribute via a regular expression.
- Remove an attribute with the subtract button. Multiple rows can be selected and removed at any one time.
- Reset the attribute table back to its default state with the "Reset" button.
- Clear the table using the "Clear" button. This is useful when you have a large table but only want to show a small number of attributes. Instead of manually removing each row, it may be quicker to clear the table and add the rows needed.
- Cell headings can be altered by adding the custom text in the "Heading" column.
- Cell alignment can be managed with the "Alignment" column which will dictate the texts position within the table cell.
- Cell width can be manually managed by adding custom values to the width column.
